# Moving (Replace) or Removing (Remove) an Object from a Collection
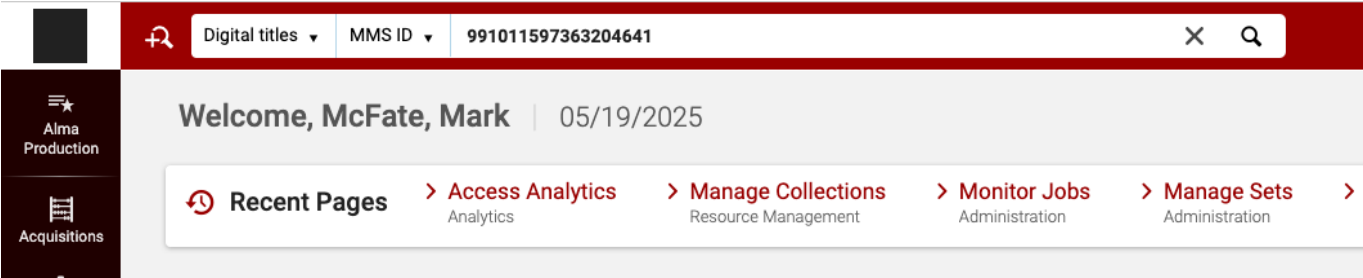

There are a handful of ways to do this in Alma, with or without Primo. The technique I use looks like this...

1. Find the object(s) in `Primo` using a search. You could also do this in `Alma`, but searching in `Primo` is generally easier and the options you have generally provide better control and results.

In this example the objects to be moved were errantly in the `PHPP — Community Contributions` collection (they should be in `Drake Community Archives`) and all had the term `cyclone` in the title. So, I searched the `PHPP — Community Contributions` collection for `cyclone` and got the result you see below.

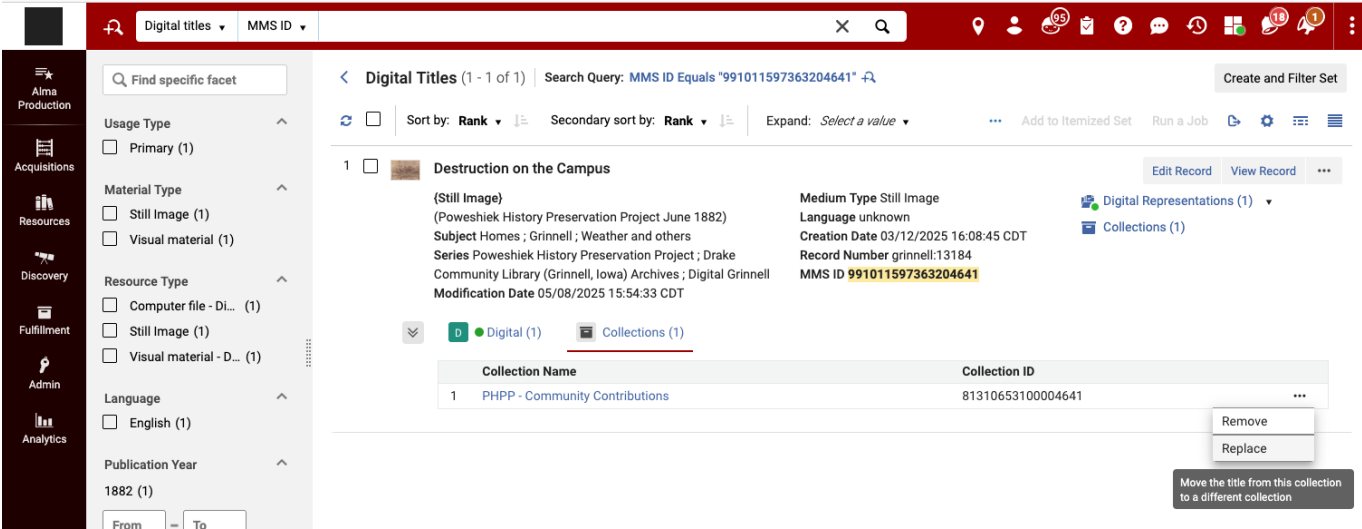

2. For each object to be moved, open the object in `Primo` and copy its `MMS_ID`.

3. Open the corresponding object in `Alma` using the `MMS_ID` as search criteria there, as shown below.

4. With the object displayed in `Alma`, click on the `Collections (n)` link either at the bottom of the record display or on the right.

5. Confirm that the collection list is correct or not. If a change is necessary click on the ... menu associated with the errant collection name, like so:

6. Click Remove to remove the object from the collection, or more likely, the Replace option to MOVE the object from its current collection to another.

7. With the Replace option you will be prompted to search for and select the target collection.

8. Confirm your Remove or Replace selection if prompted to do so and Select to complete the operation if needed.

9. Repeat steps 2 through 8 as needed.
